

Practical No. 9

Aim:

To understand & practice the process of taking a backup of a MySQL database and restoring it to ensure data security and disaster recovery.

Objectives:

- To learn the importance of dataset backup.
- To learn different types of MySQL backups.
- To perform dataset backup using MySQL utilities.
- To restore a MySQL database from a backup file.
- To ensure data security & disaster recovery.

Theory:

1. Backup:

Backup means creating a copy of the database so that it can be used later the original data is lost or corrupted.

2. Recovery (Restore):

Recovery means restoring the database from the backup files.

Procedure:

Part A : Taking Backup.

1. Open command Prompt.
2. Navigate to MySQL bin directory.
3. Use the following command.

```
mysqldump -u root -p database_name >
backup.sql
```

4. Enter password.

5. Backup File (backup.sql)

Part B : Dropping Database.

```
DROP DATABASE database_name;
```

Part C : Restoring Database.

1. Create database again:

```
CREATE DATABASE database_name;
```

2. Restore Using command:

```
mysql -u root -p database_name <
backup.sql
```

Conclusion :

Backup and recovery are very important to protect data from loss. Using MySQL roots, we can easily take backup and restore the database whenever required.
